Re: Proposed Residential Redevelopment  
135, 141, and 149 Gano Street Apartments  
Providence, Rhode Island

Dear Mr. Alten:

BETA Group, Inc., in accordance with our scope of services, has completed a traffic impact study for a proposed residential redevelopment project in the City of Providence, Rhode Island. The site is located along the easterly side of Gano Street just south of its junction with Power Street. The property immediately abuts a recreational facility, Gano Park to the east and a Dunkin Donuts to the south. The parcel is currently fully developed with three commercial buildings and associated parking.

Based upon our discussions and a review of the plans provided by *Joe Casali Engineering, Inc.*, it is our understanding that the redevelopment project includes razing the three existing structures to allow construction of one, four story building accommodating 54 residential apartment units. Access and egress to the site is proposed at a single driveway on Power Street.

The study included herein, was conducted to determine the adequacy of the existing servicing roadways to accommodate anticipated traffic to be generated by the residential redevelopment project. An analysis of potential impacts to the roadway capacity and safety has been completed and is discussed in the following report.

Very truly yours,  
BETA Group, Inc.

Paul J. Bannon  
Associate

## 1.0 INTRODUCTION

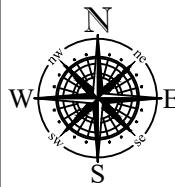

The objective of the following study is to assess the potential traffic impacts associated with a proposed residential redevelopment project in the City of Providence, Rhode Island. The new residential apartments will be situated on a parcel of land on the southeast corner of the intersection of Gano Street with Power Street, just west of the *Gano Park* recreational facility. Refer to the Figure 1, Project Vicinity Map, on the following page for the project location within the city.

The residential redevelopment proposal consists of razing three commercial structures to allow construction of a new, four-story building containing 54 residential apartment units. The ground, or first floor of the structure, will be a garage accommodating a total of 56 parking spaces. Access/egress to the garage is proposed from a single driveway on Power Street at the northeast corner of the building.

The study summarized herein focused on both traffic flow efficiency and safety along Gano Street and Power Street in the immediate vicinity of the subject property, including at the proposed site driveway. The potential impacts associated with the site related traffic have been defined and evaluated in accordance with standard traffic engineering guidelines and procedures.

The traffic engineering study completed for this project included the following:

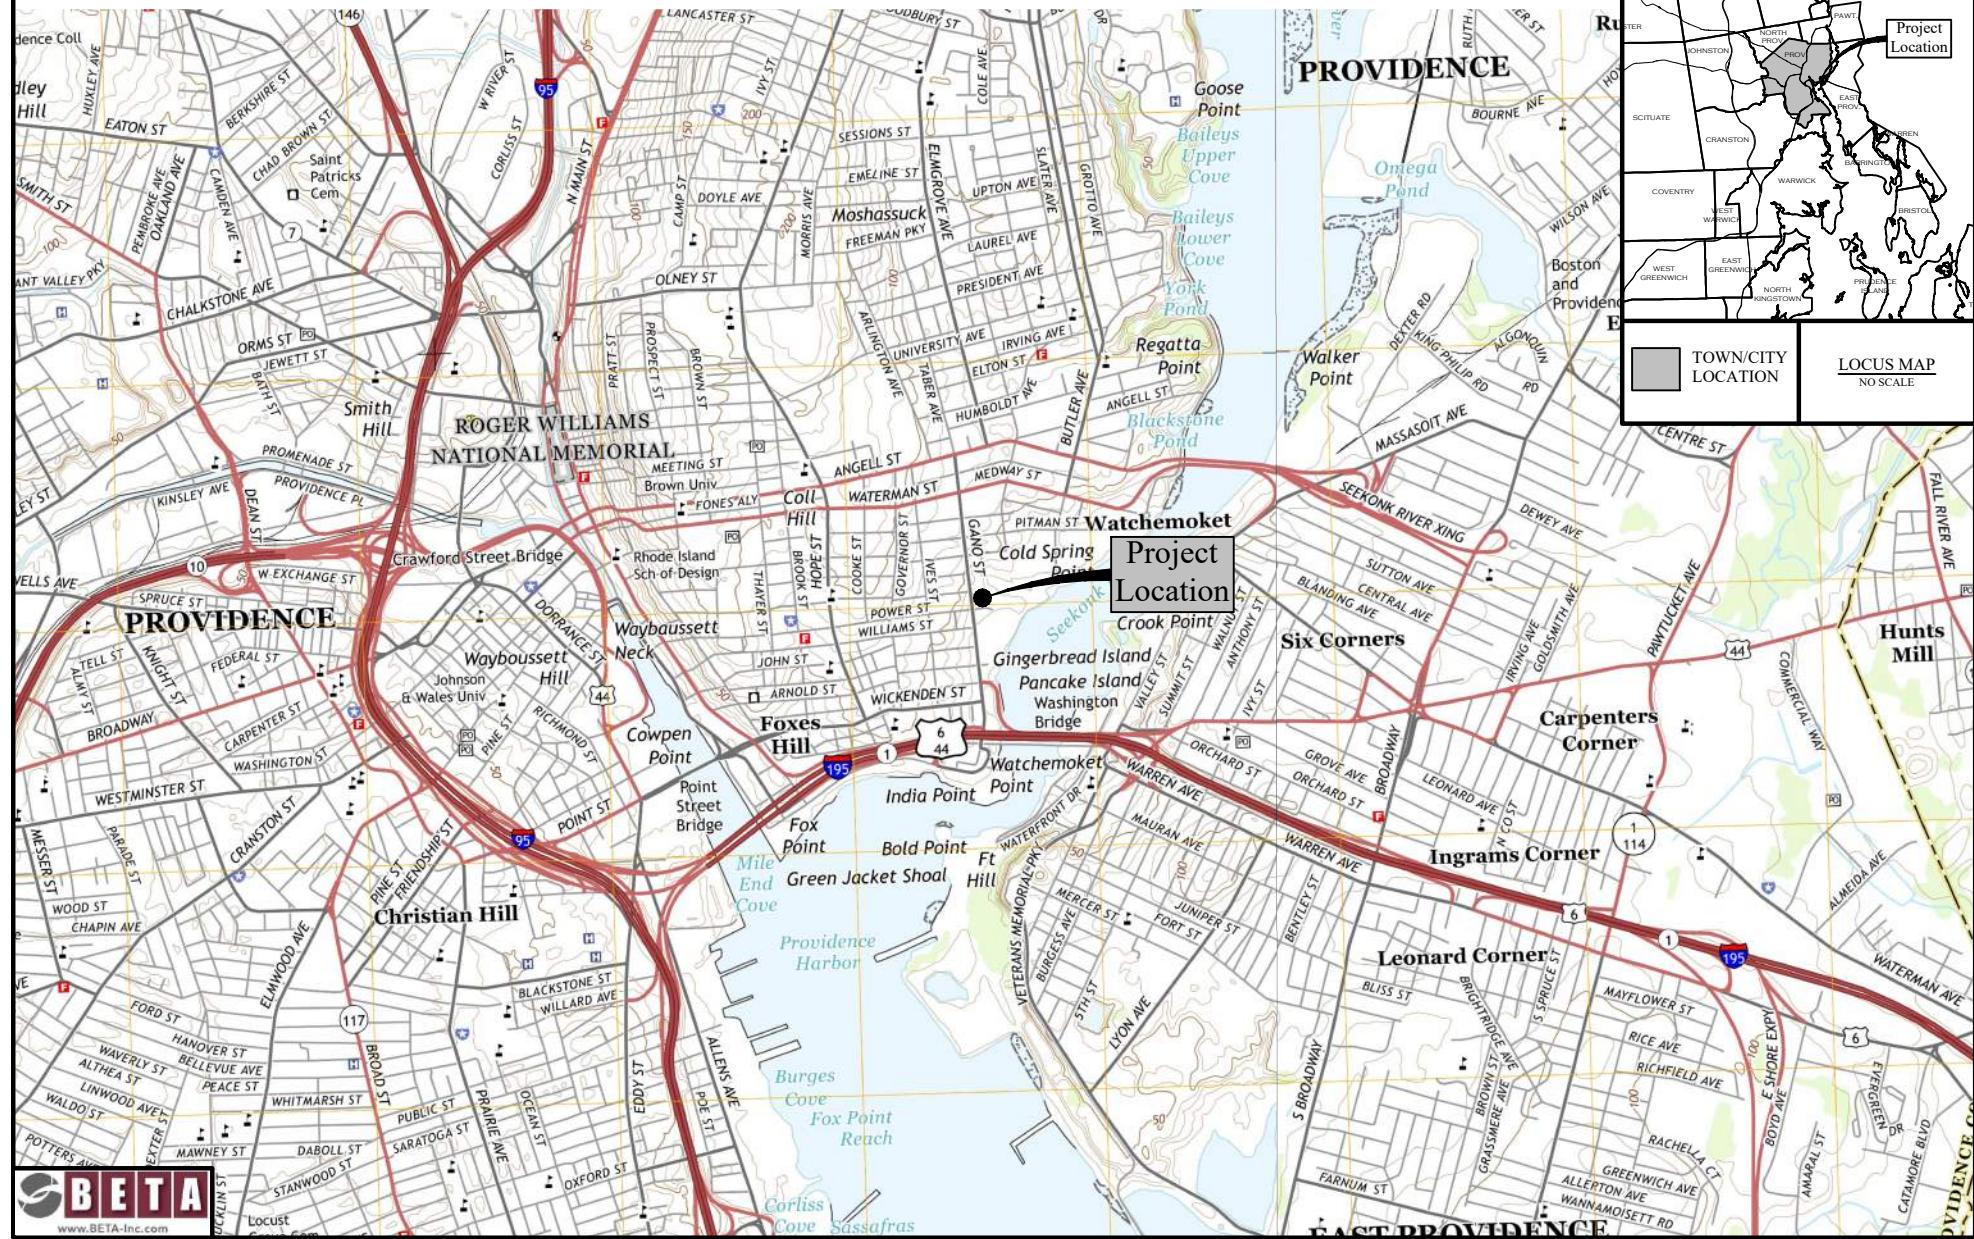

- A traffic counting program to define the existing traffic patterns and operational characteristics along the servicing roadways. The data collection included review of record traffic information available from the Rhode Island Department of Transportation (RIDOT), record data on file in our office from previous studies, an Automatic Traffic Recorder (ATR) count on Gano Street along the property frontage and a manual Turning Movement Count (TMC) at the intersection of Gano Street with Power Street.
- An inventory of the physical roadway characteristics of Gano Street, Pitman Street and Power Street in the immediate site vicinity to determine the adequacy of the existing roadway geometric features in reference to safety and operations.
- An analysis of crash records obtained from the Providence Police Department to determine if there are any safety concerns relative to the frequency, severity, or pattern of crashes in the project area.
- An estimate of future traffic volumes for the proposed residential redevelopment was calculated using data from the "Trip Generation" Manual, an informational report published by the Institute of Transportation Engineers (ITE).
- Evaluation and analysis of the traffic safety and operational issues for existing and future traffic conditions.
- Development of recommendations where necessary, that would be required to maintain safe and efficient traffic flow in the project area.

# Proposed Residential Redevelopment

PROVIDENCE, RHODE ISLAND

Figure 1 - Project Vicinity Map

## 2.0 PROJECT AREA

As noted in the previous section, the proposed residential apartment project is situated on a parcel of land at the southeast corner of the intersection of Gano Street with Power Street within the Fox Point neighborhood. The 22,500 square foot site is fully developed with three commercial structures and associated paved parking lots and is defined by Assessor's Plat 14, Lots 324, 325, 357 and 574. Figure 2 on the following page depicts the general project area, and the boundary lines of the subject property.

Land use in the immediate area can be defined as predominantly high-density residential properties along the westerly side of Gano Street including in neighborhoods off of intersecting side streets. A majority of the properties along the easterly side of the Gano Street extending to the north from I-195 contain small commercial businesses in commercial buildings or converted residential buildings. Immediately abutting the subject site to the south is a commercial property containing a Dunkin Donuts. To the east is the *Gano Park* which has frontage along the Seekonk River and includes recreational fields and public garden. To the west across Gano Street are residential properties. Further to the northeast within the College Hill neighborhood is the Brown University campus. Further south is the I-195 corridor and India Point Park.

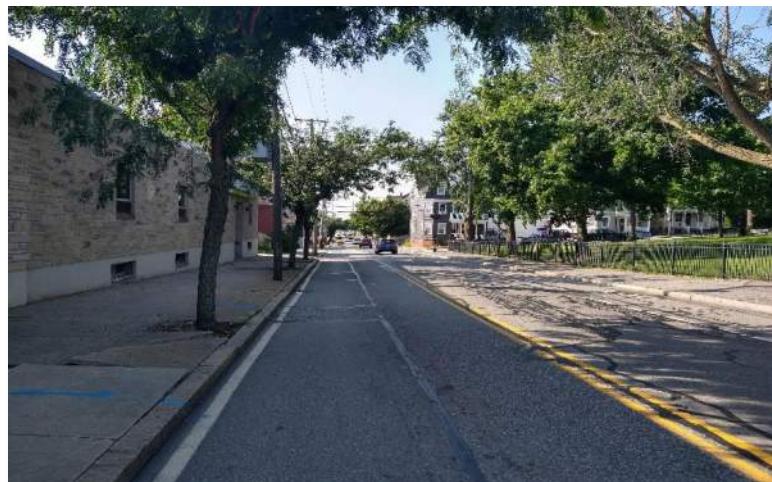

Gano Street will serve as the primary access route to the redeveloped property, with Power Street providing immediate local access. Based upon the operating characteristics along the servicing roadways, and the low estimated volume and type of traffic associated with the residential redevelopment, a study impact area was defined for the project. The limits of our analysis focused on Gano Street between Pitman Street southerly to Route 195 and Power Street east of Gano Street and specifically at the site driveway intersection.

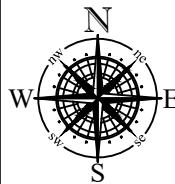

## 3.0 EXISTING CONDITIONS

### 3.1 ROADWAYS

#### Gano Street

Gano Street is a north/south urban principal arterial between Angell Street to the north and India Street to the south. The roadway provides immediate local access to abutting properties but also links to higher order facilities including I-195 to the south. In the project area, the roadway is generally thirty (30) feet wide consisting of an 11-foot travel lane in each direction with an eight foot parking lane along the southbound side. Granite curbing and a mixture of cement and bituminous concrete sidewalks are provided on both sides of the road.

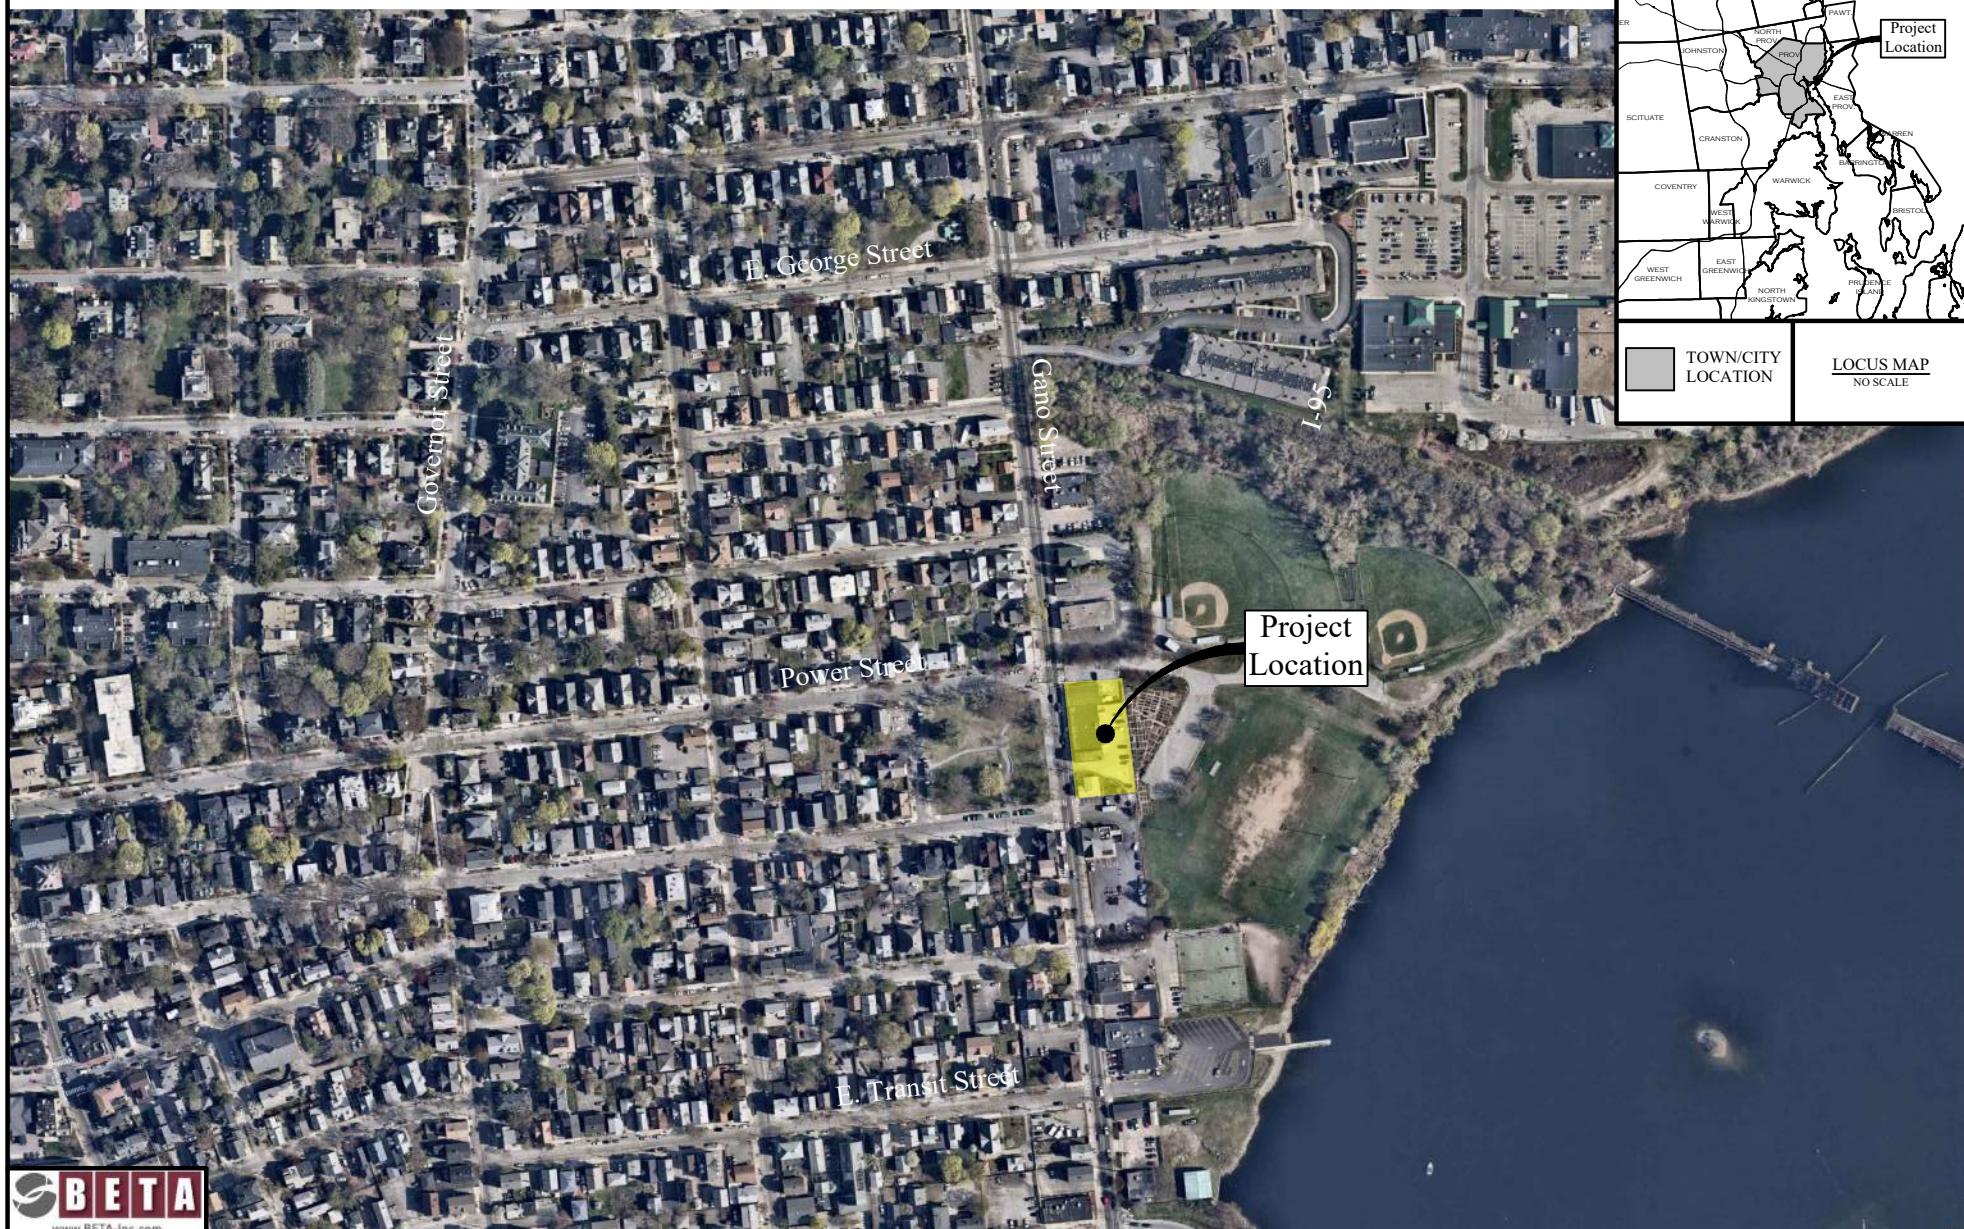

# Proposed Residential Redevelopment

PROVIDENCE, RHODE ISLAND

Figure 2 - Project Area Map

The pavement surface can be classified as being in fair condition with visible minor rutting and crack sealing. Cobra head lighting is provided for night time visibility along the roadway and at intersections. The speed limit is posted at 25 mph. The photograph on Page 3 depicts the typical roadway characteristics of Gano Street looking south with the subject property on the left side.

### Power Street

Power Street is a major collector road running in an east/west direction between South Main Street to the west to Gano Street to the east where it then becomes a short, 500 foot long local, dead-end street to *Gano Park*. The short section of Power Street east of Gano Street services one commercial property that includes the subject site, baseball fields, and public garden as noted. Along the property frontage, the roadway is generally eighteen (18) feet wide consisting of undelineated single lanes in each direction with 90-degree marked parking on the southerly side of the roadway as seen in the adjacent photograph looking west towards the Gano Street intersection with the subject property on the left side. This parking will be eliminated as part of the proposed redevelopment project.

There is no curbing or sidewalks provided along the roadway. The pavement can be classified as being in fair condition with no visible major pavement distress. There was no observed posted speed limit and was assumed at 25 mph due to the urban and local nature of the area. There is no lighting provided along this short section of Power Street.

### 3.2 INTERSECTIONS

#### Gano Street at Power Street

Power Street intersects Gano Street to form an unsignalized, four-way junction with stop control on the minor Power Street eastbound and westbound approaches. Mast arm mounted flashing beacons are provided at the intersection to enhance safety by emphasizing the traffic control and increasing visibility of the intersection that is adjacent to a small neighborhood park. Flashing yellow beacons are provided on the Gano Street northbound and southbound approaches while flashing red beacons are provided on the minor Power Street eastbound and westbound approaches. A Stop sign and stop line are also present on both the Power Street eastbound and westbound approaches to the intersection. All approaches to the intersection provide a single shared lane.

Curb ramps are provided on all corners of the intersection, though they are not ADA-compliant. Marked crosswalks are available on all legs of the intersection except across the eastern leg as can be seen in the adjacent photograph.

An enhanced visibility crosswalk is also provided across the southern leg of the intersection where pedestal mounted yellow flashing signal heads with pushbuttons, though not ADA-compliant, are available for pedestrians to utilize before crossing Gano Street. Pedestrian crossing signs are also mounted on the flasher pedestal poles.

### 3.3 TRAFFIC DATA

Existing traffic flow characteristics for this area were developed from a traffic counting program conducted by BETA, and review of record data available from RIDOT and previous studies completed by our office in the immediate area. Specifically for this project BETA Group conducted Automatic Traffic Recorder (ATR) counts for a seven-day period in July 2023. This information was compared to the record ATR and turning movement counts reviewed from the previous study completed by our office in December 2021. This data was reviewed as the most recent time period for data collection occurred during the summer months when schools were not in session. Through comparing the ATR data, the November 2021 ATR count found higher traffic volumes along Gano Street, and was therefore, to be conservative utilized as the base volumes for analysis purposes. Complete count information can be found in the Appendix.

Based upon the 2021 ATR data collected, Gano Street in the project area was found to service an Average Daily Traffic (ADT) volume of approximately 16,500 vehicles per day. On a typical weekday along Gano Street, traffic volumes begin to increase at 6:00 AM with the morning commuter peak hour occurring between 8:00 and 9:00 AM. During this hour, an average volume of approximately 1,300 vehicles was recorded. After 9:00 AM, volumes decrease slightly to between 975 and 1,150 vehicles per hour, until the later afternoon peak of 1,250 vehicles serviced between 5:00 and 6:00 PM.

As record 2021 data was utilized, traffic volumes were projected forward two years from 2021 to 2023 to provide a more conservative base volume representing existing conditions. The City of Providence has seen an annual population growth of 0.7%, which was increased to 1% to maintain a conservative assessment. This population growth rate was projected onto the 2021 TMC volumes. Additionally, BETA reviewed RIDOT seasonal factors to determine if traffic patterns in November should be further adjusted to reflect average conditions. It was determined that traffic volumes in November were slightly less than

average conditions for an urban principal arterial and were therefore adjusted up by seven percent to reflect average conditions.

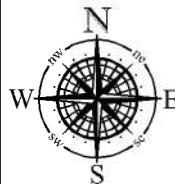

With the noted traffic adjustments applied, the November 2021 intersection turning movement count data found Gano Street along the site frontage services approximately 1,620 vehicles during the weekday morning peak hour between 7:30 and 8:30 AM with approximately 925 vehicles northbound and 695 vehicles southbound. During the same time period, Power Street along the property frontage was found to service 25 vehicles with 10 vehicles eastbound and 15 vehicles westbound. During the weekday afternoon peak hour between 4:30 and 5:30 PM, Gano Street serviced 1,470 vehicles with approximately 685 vehicles northbound and 785 vehicles southbound. During the same time period, Power Street was found to service 50 vehicles with 25 vehicles eastbound and 25 vehicles westbound. Figure 3 on the following page depicts the daily peak hour turning movement volumes at the study intersection. Complete count information can be found in the Appendix.

## 4.0 SAFETY ANALYSIS

To determine if there are any limiting factors affecting safety relating to access to the proposed residential project, the physical characteristics of Gano Street and Power Street in the project area were investigated. These limiting factors would potentially include horizontal or vertical alignment changes or roadside obstructions that limit sight distances for vehicles traveling along the road or entering the road from a side street or driveway location. In this instance, the sight distance standard is necessary to permit turning vehicles to safely enter and exit the site driveway.

The horizontal and vertical alignment of Gano Street in the project area can be described as generally straight with a vertical decline from north to south, with no limiting factors for sight distances. Based upon the existing roadway geometry as described, the available stopping sight distances at the Power Street junction are greater than 500 feet to the north and south. The value to the north is in excess of AASHTO's recommended minimum sight distance of 158 feet based on the posted speed limit of 25 mph and greater than 186 feet based on the measured 85<sup>th</sup> percentile vehicle speed of 28 mph with a 3% downgrade. The available sight distance to the south is greater than the AASHTO's recommended minimum sight distance of 147 feet based on the posted speed limit of 25 mph and the measured 85<sup>th</sup> percentile vehicle speed of 25 mph with a 3% upgrade. However, it should be noted that on occasion, parking on the westerly side of Gano Street creates obstructions that can limit sight distances for vehicles exiting from eastbound Power Street. In an effort to enhance safety and limit vehicles parking in the vicinity of the Power Street intersection, it is recommended that parking restriction signs be placed a minimum of 40 feet north and south of the Power Street junction, prohibiting parking on the westerly side of Gano Street in the immediate area of the intersection.

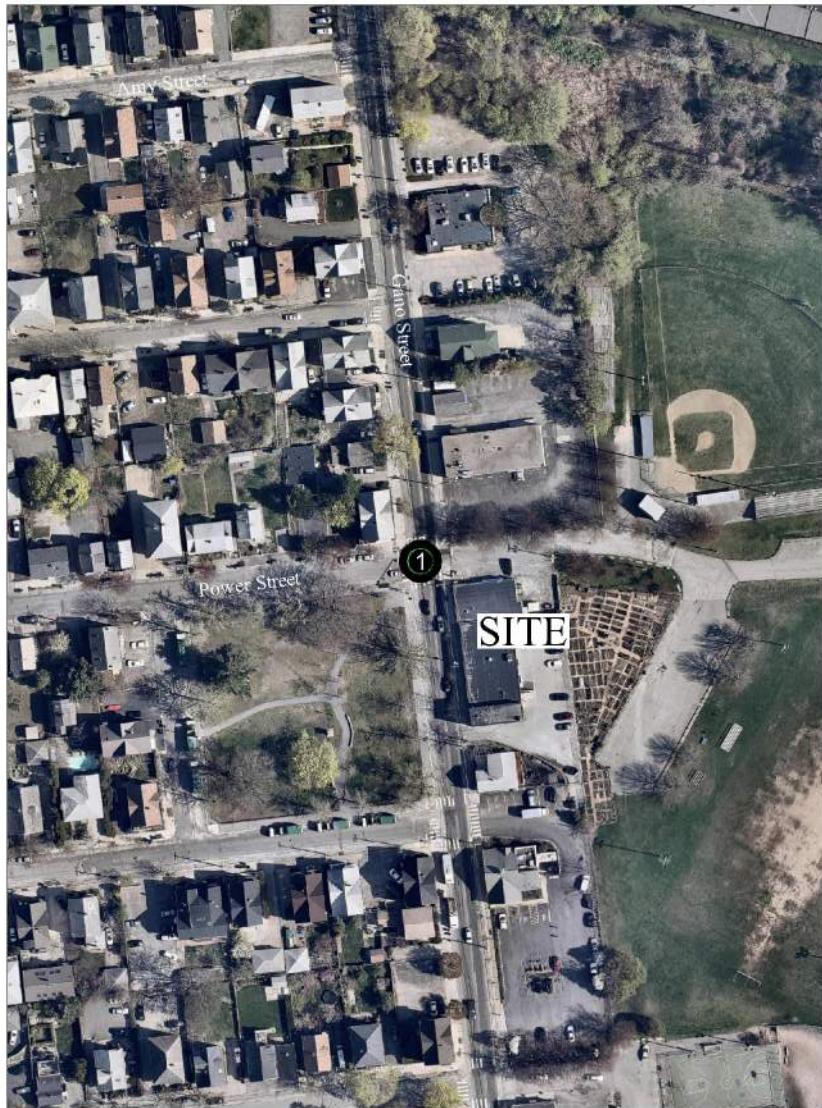

The vertical and horizontal alignment of Power Street between Gano Street and its eastern terminus can be described as generally level with a gradual "S" curve just east of the site. These physical features of Power Street described provide stopping sight distances greater than 250 feet to the east and in excess of 150 feet through the unsignalized junction with Gano Street to the west. These values are greater than AASHTO's recommended minimum sight distance of 115 feet based on the low travel speeds of between

- TRAFFIC SIGNAL

15 to 20 mph. It should be noted that the speeds are very low due to the controlled junction with Gano Street, where vehicles are turning off or on to Gano Street at a very low speed, or are slowing to the stop line. Additionally, drivers sight lines can be hindered as they exit the proposed site driveway by trees and vegetation to the east. It is assumed some of the existing trees would be removed during construction but should be noted.

Also, as part of our analysis of safety, a review of crash statistics at the study intersection of Gano Street with Power Street was completed. The initial effort included a review of data obtained in the previous study completed by our office as noted. As part of the earlier study, data was reviewed from the City of Providence Police Department for the full three-year period between 2017-2019 to determine if any location in the immediate vicinity of the development experienced a high frequency or pattern of crashes.

A total of two crashes (avg. 1 per year) occurred at the study intersection of Gano Street with Power Street over the three-year study period, with one involving an injury. Both crashes were angle collisions that can be attributed to roadway conditions (snow/ice). Due to the low incidence of crashes found at this location from previous analysis of the junction, it was determined that no additional review of more current data (2022) was needed for this study, as there was no record of a high occurrence or pattern of crashes that would warrant safety enhancements other than what has been recommended relating to on-street parking.

## 5.0 IMPACT ANALYSIS

### 5.1 TRIP GENERATION

To determine the traffic impact of a proposed development, estimates of anticipated traffic to be generated by a particular land use must be calculated. As previously discussed, the development proposal consists of the construction of one, four-story building with 54 residential apartment units. Access will be provided at a new driveway on Power Street. Figure 4 on the following page depicts the site layout and access plan provided by *Joe Casali Engineering, Inc.*

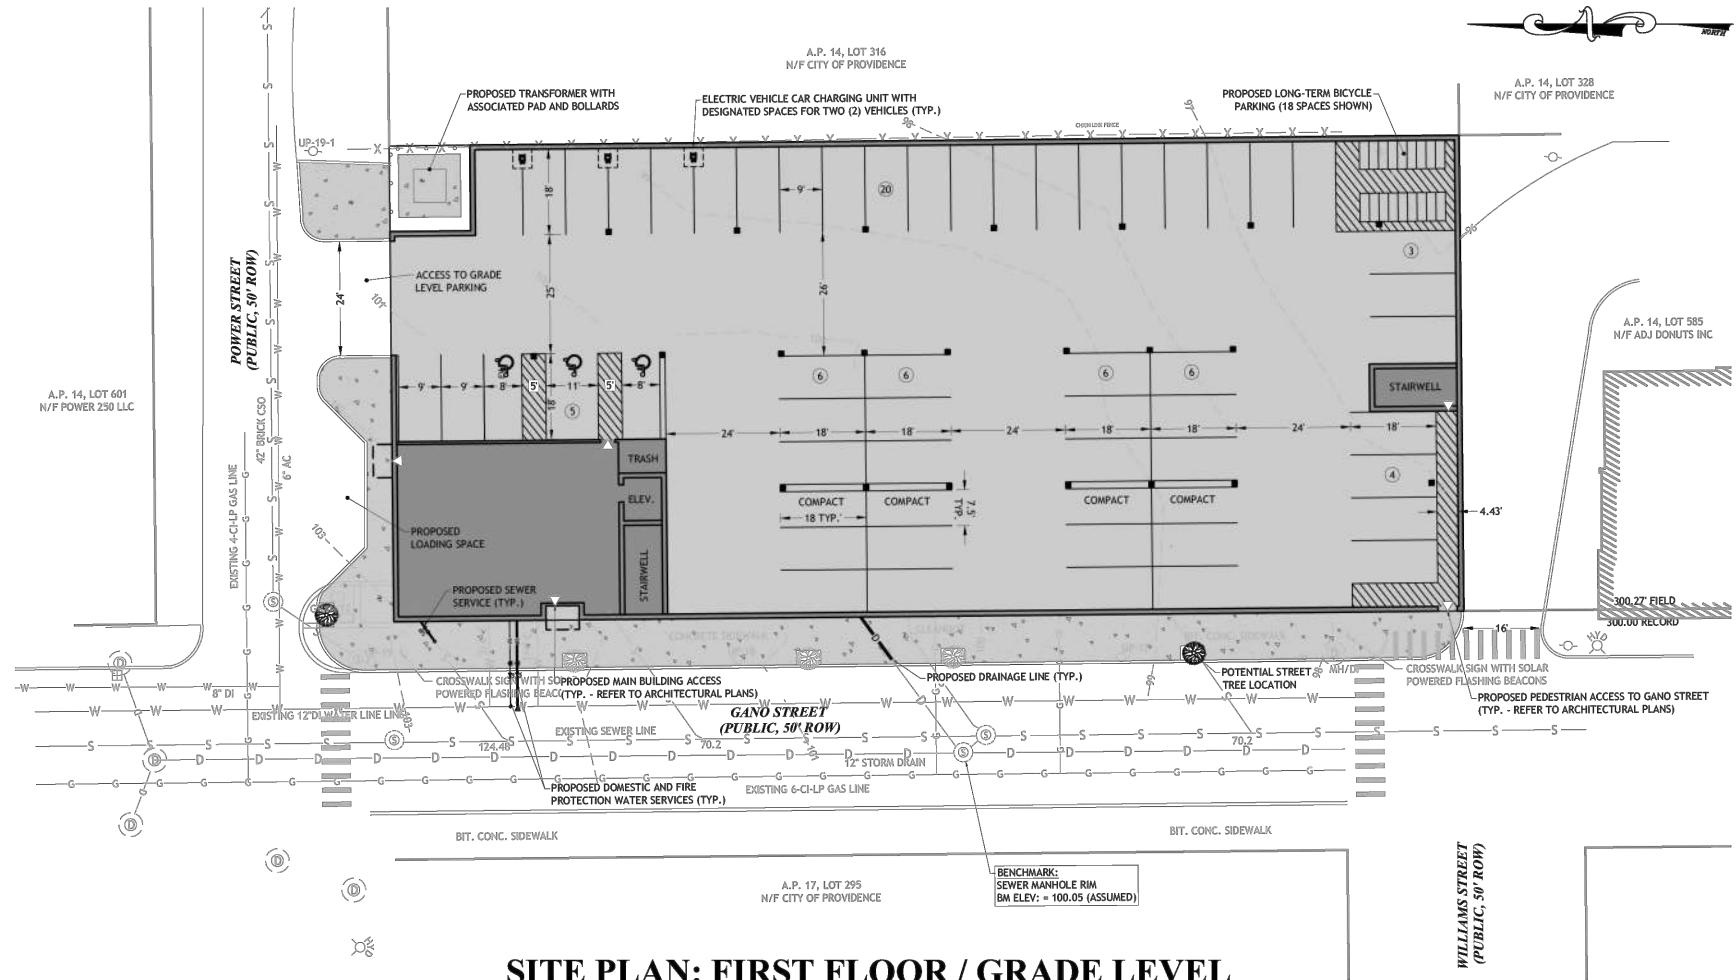

For this development, estimated traffic volumes for the residential apartment project were based on use of trip generation factors. These factors are taken from the "Trip Generation" manual, an informational report published by the Institute of Transportation Engineers (ITE), a national professional organization for traffic and transportation engineers. The data provided in the ITE report are based on extensive traffic studies for various types of land uses (residential, commercial, industrial, etc.). This data has been found to be very reliable and provides a sound basis for estimating future trips to new development projects.

For the proposed residential project, Land Use Code (LUC) 221 Multifamily Housing (Mid-Rise) was reviewed for applicability in developing an estimate of site related vehicles trips. Table 1 summarizes the low volume estimate of peak hour site related vehicle trips for the residential use utilizing the land use code data available from the ITE manual. The appropriate worksheets from the manual are included in the Appendix, along with the trip estimate calculations.

<u>Weekday PM Peak Hour</u>			
ITE Land Use Code 221	Multifamily Housing (Mid-Rise)	13	9

## 5.2 FUTURE TRAFFIC CONDITIONS

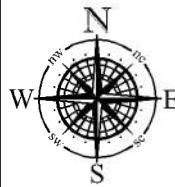

In order to properly assess the impacts of a development, future traffic conditions of area roadways should be estimated for the period when the development is constructed and fully occupied. Typically, the expansion of base traffic is calculated when a project is to be constructed over an extended period (+3 to 5 years). In all instances, area growth that may affect capacity results should be considered. For this project, a conservative annual growth rate of one percent was utilized for the future background traffic growth of Gano Street as mentioned prior.

In addition to a base background growth, coordination with the city was completed to determine if there were any site-specific development/redevelopment projects in the area currently under board/commission review or have recently been approved that would impact existing traffic conditions. Based upon this coordination it was determined that a residential development containing 83 apartment units has been approved at the northeast corner of the intersection of Gano Street with Trenton Street and the I-195 westbound off-ramp. Additionally, another residential project along Power Street, consisting of 140 residential units, directly to the north of the proposed site has been approved for development. Therefore, to establish a Future 2028 Build traffic condition the subject 54-unit residential development project and the known future residential development were added to the expanded base volumes as previously defined. Figure 5 on the following page depicts the estimated future traffic volumes within the study area.

In developing the intersection volumes to be analyzed under build conditions, a directional distribution of the site traffic was estimated. The distribution was based on current traffic patterns in the area related to the intersection of Power Street at Gano Street.

## 5.3 OPERATIONAL ANALYSIS

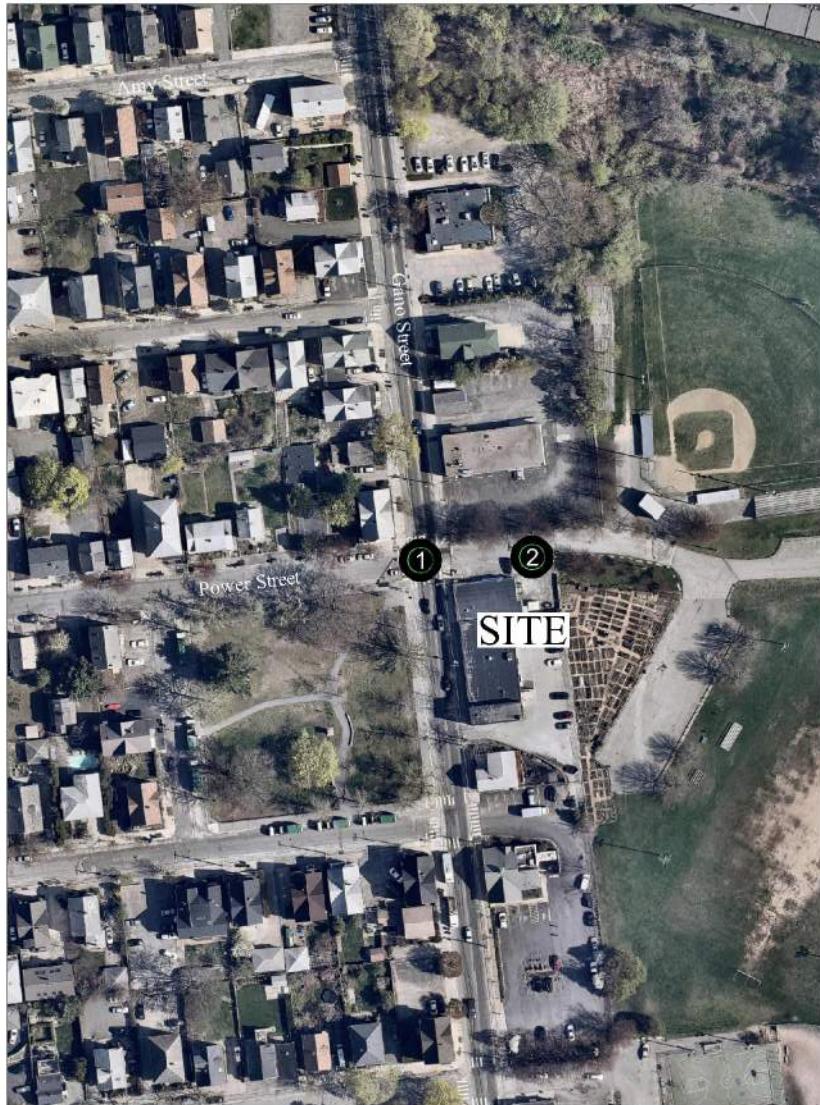

The key to any traffic impact analysis is the evaluation of roadway operations during peak traffic periods on the servicing roadway system. This situation would occur when the site-generated traffic, combined with the traffic volumes on the main roadway, result in the highest one-hour volume serviced along a roadway segment, or through an intersection. Review of record traffic data found that the weekday morning and afternoon peak hours would represent this worst-case combination of site-generated traffic with the servicing roadway peak traffic period.

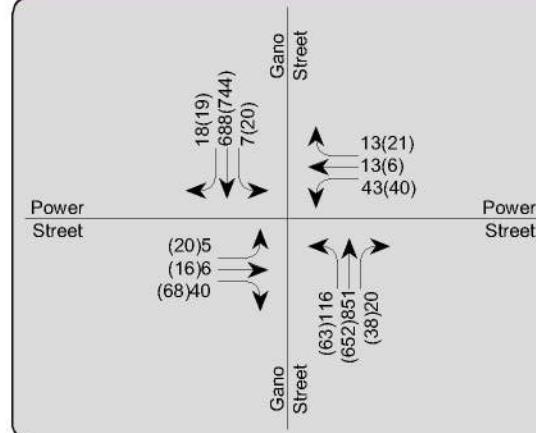

# Proposed Residential Redevelopment

PROVIDENCE, RHODE ISLAND

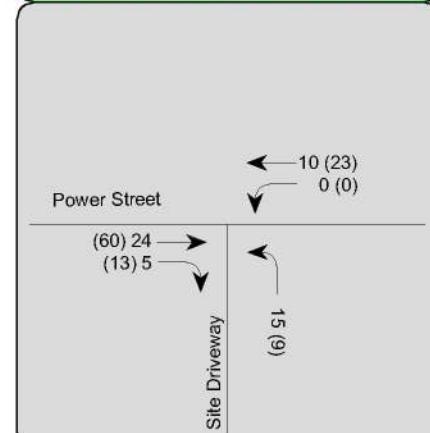

Figure 5 - Future Build Traffic Volumes

LEGEND:

- ▼ TURN LANE
- XXX AM PEAK VOLUMES (7:30 TO 8:30)
- (XXX) PM PEAK VOLUMES (4:15 TO 5:15)
- STUDY INTERSECTION
- TRAFFIC SIGNAL

The Highway Capacity Manual methodology provides the most accurate means of evaluating traffic capacity and delays for roadways and intersections. The results of these procedures are expressed in terms of Level of Service (LOS). Level of Service is a qualitative measure of traffic flow efficiency based on anticipated vehicle delays. For example, LOS "A" represents the best condition with little or no delay, while LOS "F" indicates that the roadway/intersection is at full capacity resulting in extended vehicle delays and potential queuing. Table 2 outlines the Level of Service delay criteria presented in the Highway Capacity Manual for signalized and unsignalized intersections.

TABLE 2 – Highway Capacity Manual Criteria

Level of Service	Unsignalized Delay Per Vehicle (sec)	Signalized Delay Per Vehicle (sec)
A	<10	<10
B	>10 and <15	>10 and <20
C	>15 and <25	>20 and <35
D	>25 and <35	>35 and <55
E	>35 and <50	>55 and <80
F	>50	>80

The Gano Street intersections with Pitman Street and Power Street were analyzed for the weekday morning and afternoon peak hours for Existing, Future No-Build and Future Build conditions. The capacity analysis worksheets are included in the Appendix and Tables 3 through 5 summarize the results of the analyses.

TABLE 3 – Level of Service Summary (Existing Conditions)

Location / Movement	EXISTING CONDITIONS							
	AM Peak Hour				PM Peak Hour			
	LOS	Delay	95 <sup>th</sup> % Queue Length (veh.)	v/c	LOS	Delay	95 <sup>th</sup> % Queue Length (veh.)	v/c
<i>Gano Street at Power Street (U)</i>								
Gano Street NB Left	A	9.5	1	0.13	A	9.5	1	0.07
Gano Street SB Left	A	9.5	1	0.01	A	8.8	1	0.01
Power Street EB	C	24.8	1	0.20	E	38.5	2	0.48
Power Street WB	F	>50	1	0.17	F	>50	1	0.25

(U) – Unsignalized

Table 3 depicts the current operating conditions at the study intersection. As can be seen in the table, all critical movements at the unsignalized junction of Gano Street with Power Street currently operate at LOS E or better except for the Power Street westbound approach where it experiences average delays of greater than 50 seconds during both the morning and afternoon peak periods. This is attributed to the greater delays of left turning traffic across the heavy Gano Street through traffic stream and available

gaps, though this delay typically results in only one vehicle waiting to turn onto Gano Street at any one time and no traffic congestion at the intersection.

One condition that does have a positive impact on the available gaps in traffic on Gano Street is the adjacent signalized intersections at Pitman Street to the north and Trenton Street/I-195 WB off-ramp to the south. The traffic signals help create gaps in Gano Street traffic during the minor approach traffic phases and the change intervals that driveway and side street traffic can utilize to access the main road. The positive effect of the adjacent signals cannot be sufficiently modeled into the HCS analysis, resulting in a conservative, higher estimate of delays than what is actually experienced by drivers.

Table 4 below presents the Future No-Build design period analysis taking into consideration base traffic growth including the known future developments, but not considering the subject site development. The results of the analysis found that the unsignalized intersection of Gano Street with Power Street will have the main road critical movements operating uninterrupted at a good LOS A, and with the minor side streets operating at LOS E and F, with the westbound approach experiencing the higher delays due to the number of left turn exiting traffic. Despite the greater delays, it is estimated that the worst case queuing that occurs during the morning commuter peak would be a maximum of six vehicles waiting to exit the side street.

TABLE 4 – Level of Service Summary (No Build Conditions)

Location / Movement	EXISTING CONDITIONS							
	AM Peak Hour				PM Peak Hour			
	LOS	Delay	95 <sup>th</sup> % Queue Length (veh.)	v/c	LOS	Delay	95 <sup>th</sup> % Queue Length (veh.)	v/c
<i>Gano Street at Power Street (U)</i>								
Gano Street NB Left	A	9.7	1	0.14	A	9.7	1	0.08
Gano Street SB Left	A	9.8	1	0.01	A	9.1	1	0.02
Power Street EB	E	40.9	1	0.35	F	>50	4	0.66
Power Street WB	F	>50	6	1.31	F	>50	3	0.73

(U) – Unsignalized

Table 5 on the following page presents the Future Build design period analysis taking into consideration base traffic growth including the known future developments, and also the proposed development. The results of the analysis are similar to the Future No-Build scenario with the main road critical movements operating at LOS A, and with the minor side streets operating at LOS E or F. As traffic delay gradually increases in the LOS F operating conditions, minor increases in the traffic flow will lead to greater traffic delays but not a discernable amount of additional side street queuing. As seen in the table the estimated maximum queuing increases by only approximately two vehicles during the daily peak hours of traffic and would generally average one to two vehicles during daily off-peak traffic conditions.

The unsignalized capacity analysis results for the minor approach delays are consistent with most unsignalized driveways and side street intersections along this section of Gano Street due to the high main street volumes and limitations of the unsignalized analysis as previously discussed. The signalization of the adjacent intersections will provide the benefit of additional gaps in main street traffic, reducing delays and allowing the intersection to operate in an acceptable manner with no traffic congestion.

The unsignalized intersection of the proposed site driveway with Power Street was reviewed and is anticipated to operate efficiently during both the morning and afternoon peak conditions due to the combination of low traffic volumes on Power Street and the proposed site driveway where negligible delays associated with vehicle conflicts will be realized. The only delay realized will be the delays associated with vehicles required to stop at the stop sign in advance of entering the main road, or to make the turn into the driveway, resulting in an LOS A.

TABLE 5 – Level of Service Summary (Future Build Conditions)

Location / Movement	FUTURE BUILD CONDITIONS							
	AM Peak Hour				PM Peak Hour			
	LOS	Delay	95 <sup>th</sup> % Queue Length (veh.)	v/c	LOS	Delay	95 <sup>th</sup> % Queue Length (veh.)	v/c

(S) – Signalized

(U) – Unsignalized

## 5.4 TRANSPORTATION DEMAND MANAGEMENT PROGRAM

The project's impact on the transportation system is expected to be minimal due to the small scale of the proposed residential redevelopment. However, traffic demand management strategies are proposed in conjunction with the project to further minimize the project's overall impact. The project is located approximately two miles from Downtown Providence which currently has the majority of its routes with separated bicycle facilities. Bicycle parking at the site will assist residents in taking advantage of this roadway network with a total of 18 bicycle parking spaces at the southeast corner of the first floor.

Pedestrian accessibility will be accommodated via the construction of sidewalks along the northern side of the building to tie into the existing sidewalk network surrounding the subject property. Crosswalks are currently provided at the unsignalized intersection of Gano Street at Power Street to the west, which is also surrounded by sidewalks around its perimeter.

Public transportation and car sharing services will also be encouraged and promoted by the management group of the apartment complex. The Owner will coordinate with a car-sharing service provider such as *Zip Car* or *Enterprise Car Share* to provide shared vehicles for common use. The Owner will work with the City of Providence and abutters to identify permanent on-street spaces on Gano Street reserved for car share. In addition, RIPTA's 92 bus services the project area one block to the west, providing public transportation to Downtown Providence and Federal Hill every half hour. As a method to reduce vehicle dependency, residential developments can offer free and reduced transit passes to residents without a vehicle, which have shown can reduce the amount of people driving alone in places like Fox Point.

## 6.0 CONCLUSIONS AND RECOMMENDATIONS

In summary, the study has shown that the proposed residential redevelopment project access and circulation plan has been designed to provide a level of traffic safety and efficiency on the servicing roadway system with the recommended improvements. As previously referenced, sight distance to the east is partially limited by trees to the east of the site driveway, and it is recommended they be removed and replaced further south, if possible. The safety of Gano Street and Power Street and specifically its intersection and at the site driveway were also reviewed for geometry and sight distances. The intersections reviewed were determined to provide adequate sight distances in accordance with AASHTO criteria for visibility and decision making of drivers attempting to enter/exit main street traffic from a side street or driveway location.

The results of the operational analysis determined that the estimated minor increase in traffic during the peak periods resulting from the proposed residential project will have a minor impact on overall traffic operations along the servicing roadways and would particularly be noticeable only during the daily morning and afternoon peak hours when the new residential apartments would generate their highest daily traffic volumes. During off-peak traffic conditions associated with the residential use, roadway and intersection operations would be similar to current conditions with no traffic congestion at the main study intersection of Gano Street with Power Street.

Therefore, based upon the data collected on the servicing roadways, and the analysis completed as part of this study, it can be concluded that the future traffic conditions resulting from the proposed residential development will provide for adequate and safe access to a public street, and will not have a detrimental effect on public safety and welfare in the study area.

**ITE Land Use Code**

ITE Land Use Code 221 – Multifamily Housing (Mid-Rise)

ITE Land Use Code 221 – Multifamily Housing (Mid-Rise)

# Land Use: 221

## Multifamily Housing (Mid-Rise)

---

### Description

Mid-rise multifamily housing includes apartments and condominiums located in a building that has between four and 10 floors of living space. Access to individual dwelling units is through an outside building entrance, a lobby, elevator, and a set of hallways.

Multifamily housing (low-rise) (Land Use 220), multifamily housing (high-rise) (Land Use 222), off-campus student apartment (mid-rise) (Land Use 226), and mid-rise residential with ground-floor commercial (Land Use 231) are related land uses.

### Land Use Subcategory

Data are presented for two subcategories for this land use: (1) not close to rail transit and (2) close to rail transit. A site is considered close to rail transit if the walking distance between the residential site entrance and the closest rail transit station entrance is  $\frac{1}{2}$  mile or less.

### Additional Data

For the six sites for which both the number of residents and the number of occupied dwelling units were available, there were an average of 2.5 residents per occupied dwelling unit.

For the five sites for which the numbers of both total dwelling units and occupied dwelling units were available, an average of 96 percent of the total dwelling units were occupied.

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (<https://www.ite.org/technical-resources/topics/trip-and-parking-generation/>).

***It is expected that the number of bedrooms and number of residents are likely correlated to the trips generated by a residential site. To assist in future analysis, trip generation studies of all multifamily housing should attempt to obtain information on occupancy rate and on the mix of residential unit sizes (i.e., number of units by number of bedrooms at the site complex).***

The sites were surveyed in the 1990s, the 2000s, the 2010s, and the 2020s in Alberta (CAN), California, District of Columbia, Florida, Georgia, Illinois, Maryland, Massachusetts, Minnesota, Montana, New Jersey, New York, Ontario (CAN), Oregon, Utah, and Virginia.

### Source Numbers
